Background

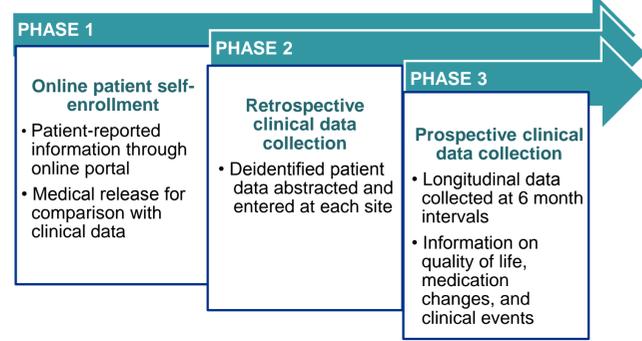

- Familial Hypercholesterolemia (FH) is a common genetic disease that leads to substantially elevated levels of low-density lipoprotein cholesterol (LDL-C)
- The 2013 ACC/AHA guidelines for treatment of Blood Cholesterol to Reduce ASCVD risk in adults denote an LDL-C level > 190 mg/dL (suggestive of FH) as an independent high-risk feature.
- Individuals with FH have a 20-fold increase in risk of early cardiovascular disease.
- Despite its prevalence, FH remains largely underrecognized: an estimated 1.5 million individuals in the U.S. have FH, yet fewer than 10% have been formally diagnosed.

The CASCADE FH Registry

- In 2013, the FH Foundation (a patient-led nonprofit organization) created the CASCADE-FH Registry.
- The CASCADE-FH Registry is a national initiative to increase FH awareness, characterize trends in treatment, and monitor clinical and patient-reported outcomes over time.
- CASCADE-FH represents a collaboration between The FH Foundation, cardiologists, primary care providers, lipid specialists, and patients with FH.

Methods

- CASCADE-FH uses a multi-pathway enrollment strategy to ensure maximum availability to interested FH patients
- Registry participants may enroll in CASCADE-FH by one of two methods:
 - 1) Enrollment by a provider in a specialized lipid clinic
 - 2) Self-enrollment via an interactive online portal for participants meeting pre-specified LDL criteria consistent with FH.

Data Elements

- Demographics
- Medical history and laboratory values
- Current lipid-lowering therapies
- Clinical events (hospitalizations, mortality)
- Patient-reported outcomes (QOL, treatment satisfaction)

Data Analysis

- Baseline characteristics presented as percentages for categorical variables and medians with interquartile ranges (IQRs) for continuous variables

Results

Table 1. Baseline Characteristics of the CASCADE-FH Patient Population (September 2013 – February 2015).

Variable	Overall (N=1605)	Online Portal (N=215; 13.4%)	Clinical Sites (N=1390; 86.6%)
Median age, years (IQR)	53.0 (37.0, 64.0)	52.0 (41.0, 60.0)	53.0 (36.0, 65.0)
<18 years of age	8.2	---	10.2
White race, %	81.4	92.7	79.6
Female sex, %	58.7	72.7	56.6
Formal FH diagnosis, %	97.4	80.6	100.0
Family member with FH, %	31.5	46.7	29.2
Prior MI, %	12.4	17.2	11.6
Prior PCI, %	17.0	19.4	16.6
Prior CABG, %	13.8	14.9	13.6
Diabetes	11.5	9.3	11.9
Hypertension	39.6	32.1	40.8
Current Smoker	6.2	3.7	6.6
Historical Highest LDL-C (mg/dL)	249.0 (211.0, 310.0)	290.0 (231.0, 355.0)	245.0 (210.0, 303.0)
Current LDL level (mg/dL)	143.0 (107.0, 196.0)	150.0 (118.0, 200.0)	143.0 (107.0, 196.0)

Abbreviations: MI=myocardial infarction; PCI=percutaneous coronary intervention; CABG=coronary artery bypass graft
 *High-intensity statins defined as atorvastatin≥40 mg or rosuvastatin≥20 mg

Table 2. Treatment patterns of the CASCADE-FH Patient Population (September 2013 – February 2015).

Variable	Overall (N=1605)	Online Portal (N=215; 13.4%)	Clinical Sites (N=1390; 86.6%)
Currently treated with statins, %	74.1	73.0	76.0
Currently treated with high-intensity statins*, %	55.8	63.5	54.6
Number of LLT			
0	10.8	17.2	9.8
1	33.6	35.4	33.4
2	25.6	8.8	28.1
3+	30.0	38.6	28.7

*Among patients treated with statins
 Abbreviations: LLT=Lipid lowering therapy

Results (continued)

Figure 1. Percent of patients reporting that they "completely understand" the following about FH*

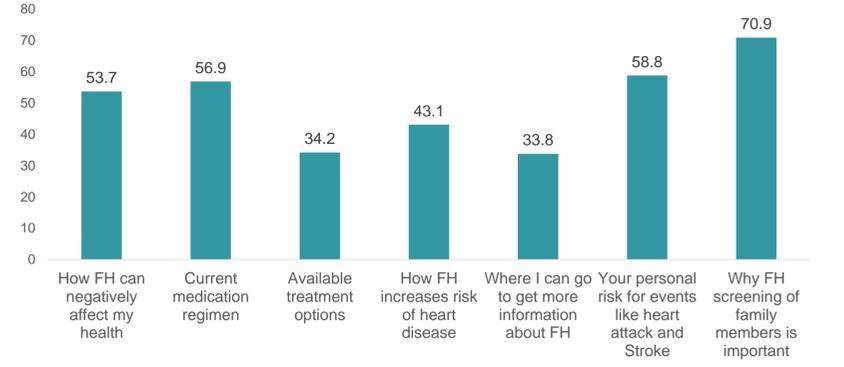

Figure 2. How satisfied are you that everything possible is being done to treat your FH?*

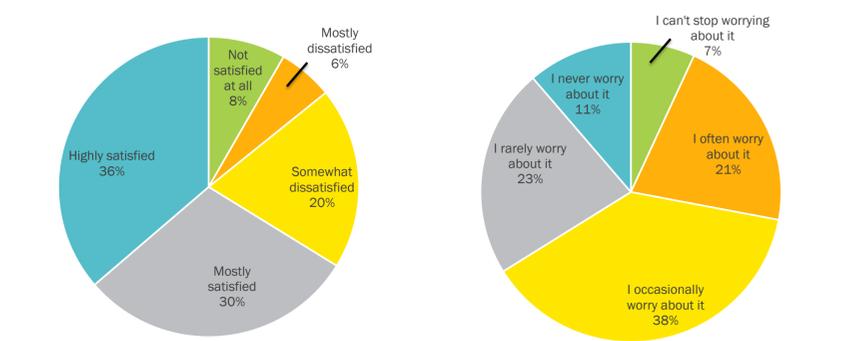

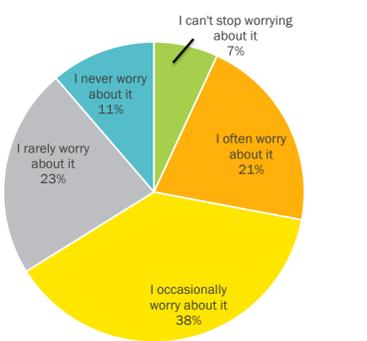

Figure 3. How often do you worry that you may have a heart attack or die suddenly?*

Conclusions

- The CASCADE-FH Registry represents a collaboration between FH patients and clinical researchers who have partnered to address gaps in knowledge regarding FH screening, identification, and treatment.
- CASCADE-FH will evaluate future longitudinal treatment patterns and outcomes in this high risk patient population

Funding/disclosures

The CASCADE FH Registry has been supported by Amgen, Astra Zeneca, Regeneron, Sanofi and Aegerion.
